XXXXXXX Analytics

Business Intelligence Report FY 2025 | B2B SaaS Platform

MRR by plan · Revenue Concentration · Pareto Analysis · Dual-engine structure

Executive Summary

A full-year analytics engagement covering **800 company accounts**, **16,050 users**, **905 subscriptions**, **838,790 product events**, **1,411 invoices**, and **3,676 support tickets** across three integrated data sources.

💰 Revenue Health

Top 20% of customers generate **59.8% of MRR.** It is well below the 80/20 Pareto benchmark, indicating a balanced, resilient customer base.

🚀 Growth Engine

The **Growth plan** (257 companies) generates comparable MRR to Enterprise (53 companies) through volume, the most strategically important tier.

⚠️ Churn Risk

655 active companies scored for churn risk. High-risk segment driven by product inactivity exceeding 30 days and failed invoice payments.

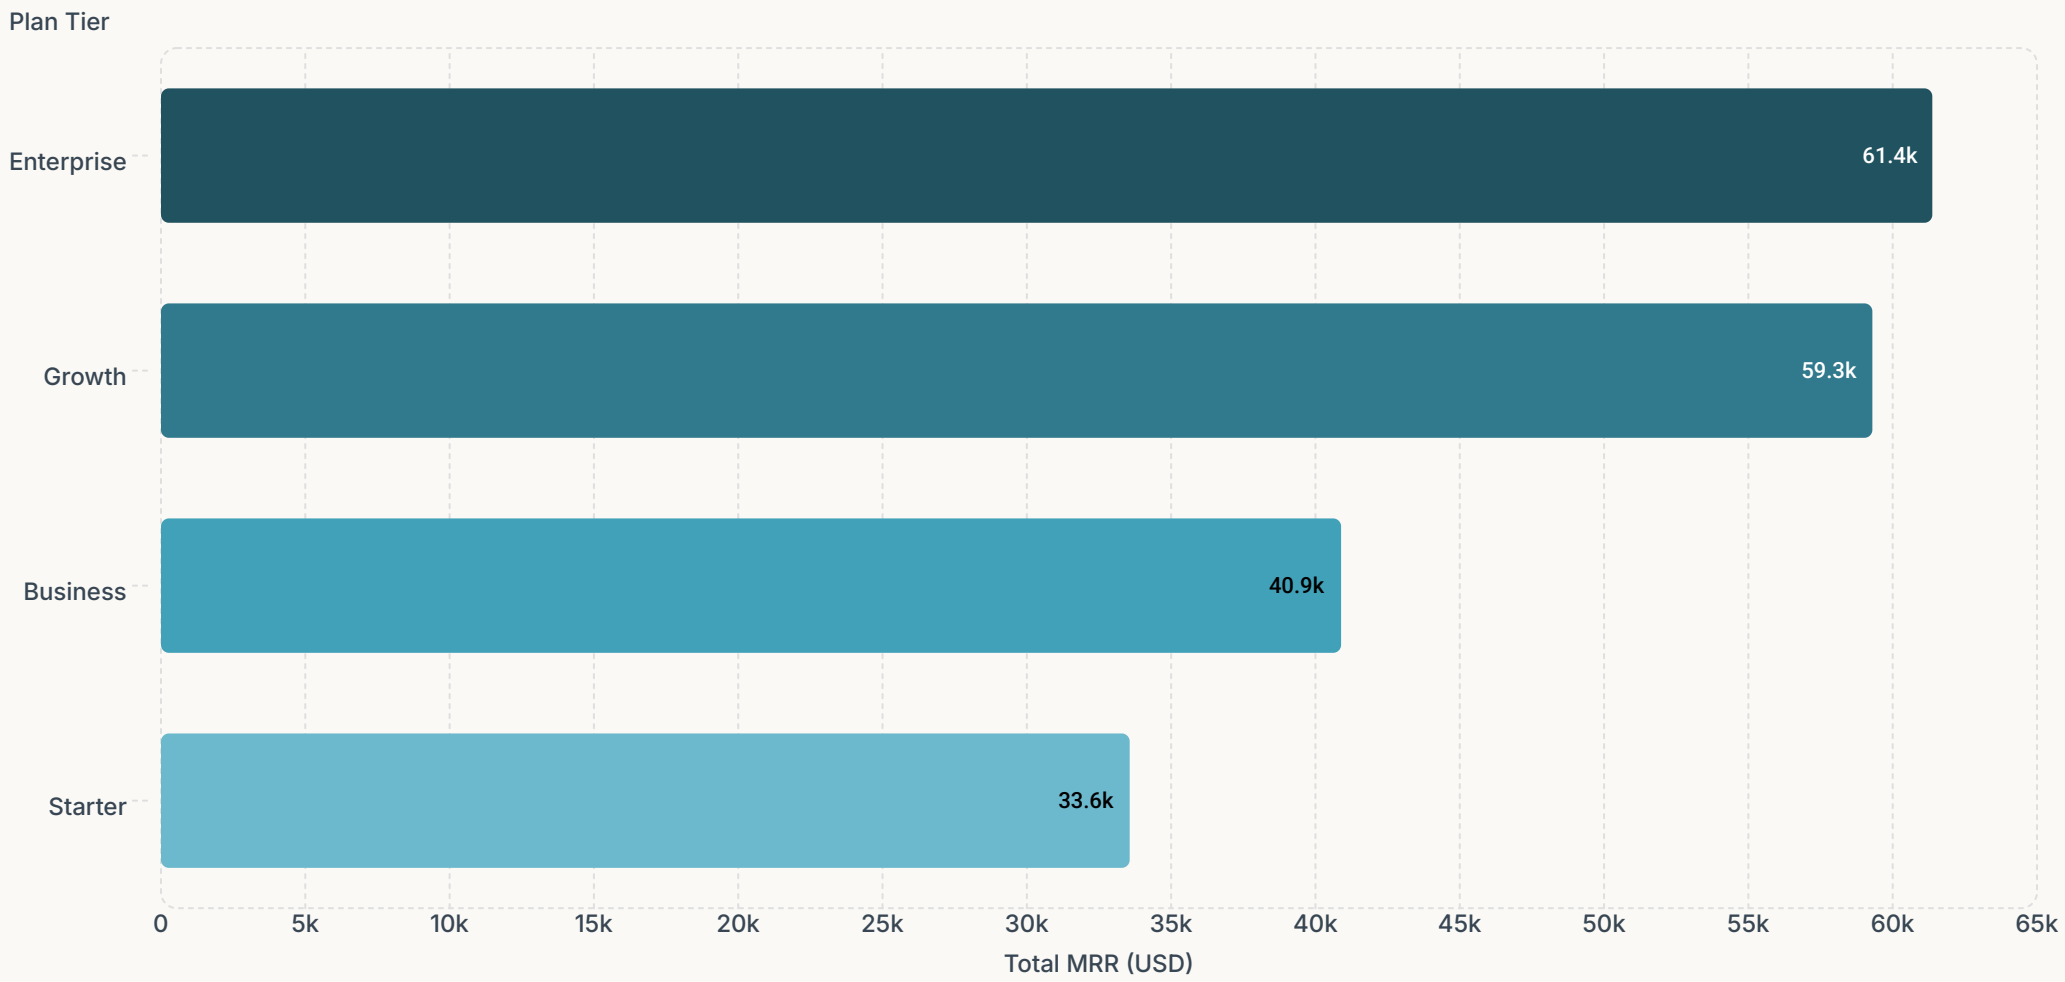
📊 Feature Adoption

dashboard_view and **report_create** lead engagement. API usage skews Enterprise, creating natural switching costs that protect revenue.

✓ Starter tier (220 companies, 17.2% MRR) represents an untapped expansion opportunity of converting 20% to Growth would deliver meaningful MRR uplift.

Revenue Health

Revenue analysis conducted across the full subscription dataset covering all active, churned, and converted subscription periods. MRR figures represent monthly recurring revenue in USD.



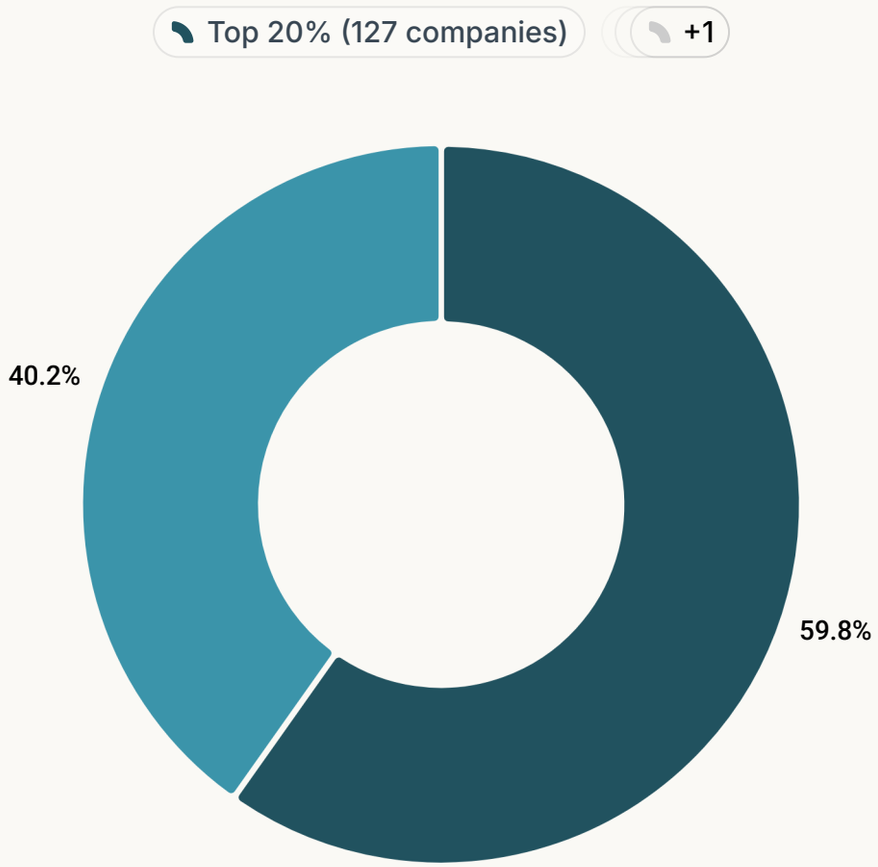
Dual-Engine Structure

Enterprise (53 accounts, avg $1,158 MRR) and Growth (257 accounts, avg $231 MRR) deliver near-equal aggregate revenue through fundamentally different mechanisms — concentration vs. volume.

Plan	Companies	Total MRR	Avg MRR
Enterprise	53	$61,373	$1,158
Growth	257	$59,296	$231
Business	107	$40,888	$382
Starter	220	$33,563	$153
Total	**637**	**$195,120**	**$306**

Revenue Concentration Analysis

A Pareto analysis was conducted to assess revenue concentration risk — the degree to which the business depends on a small number of high-value accounts.



Healthier Than Benchmark

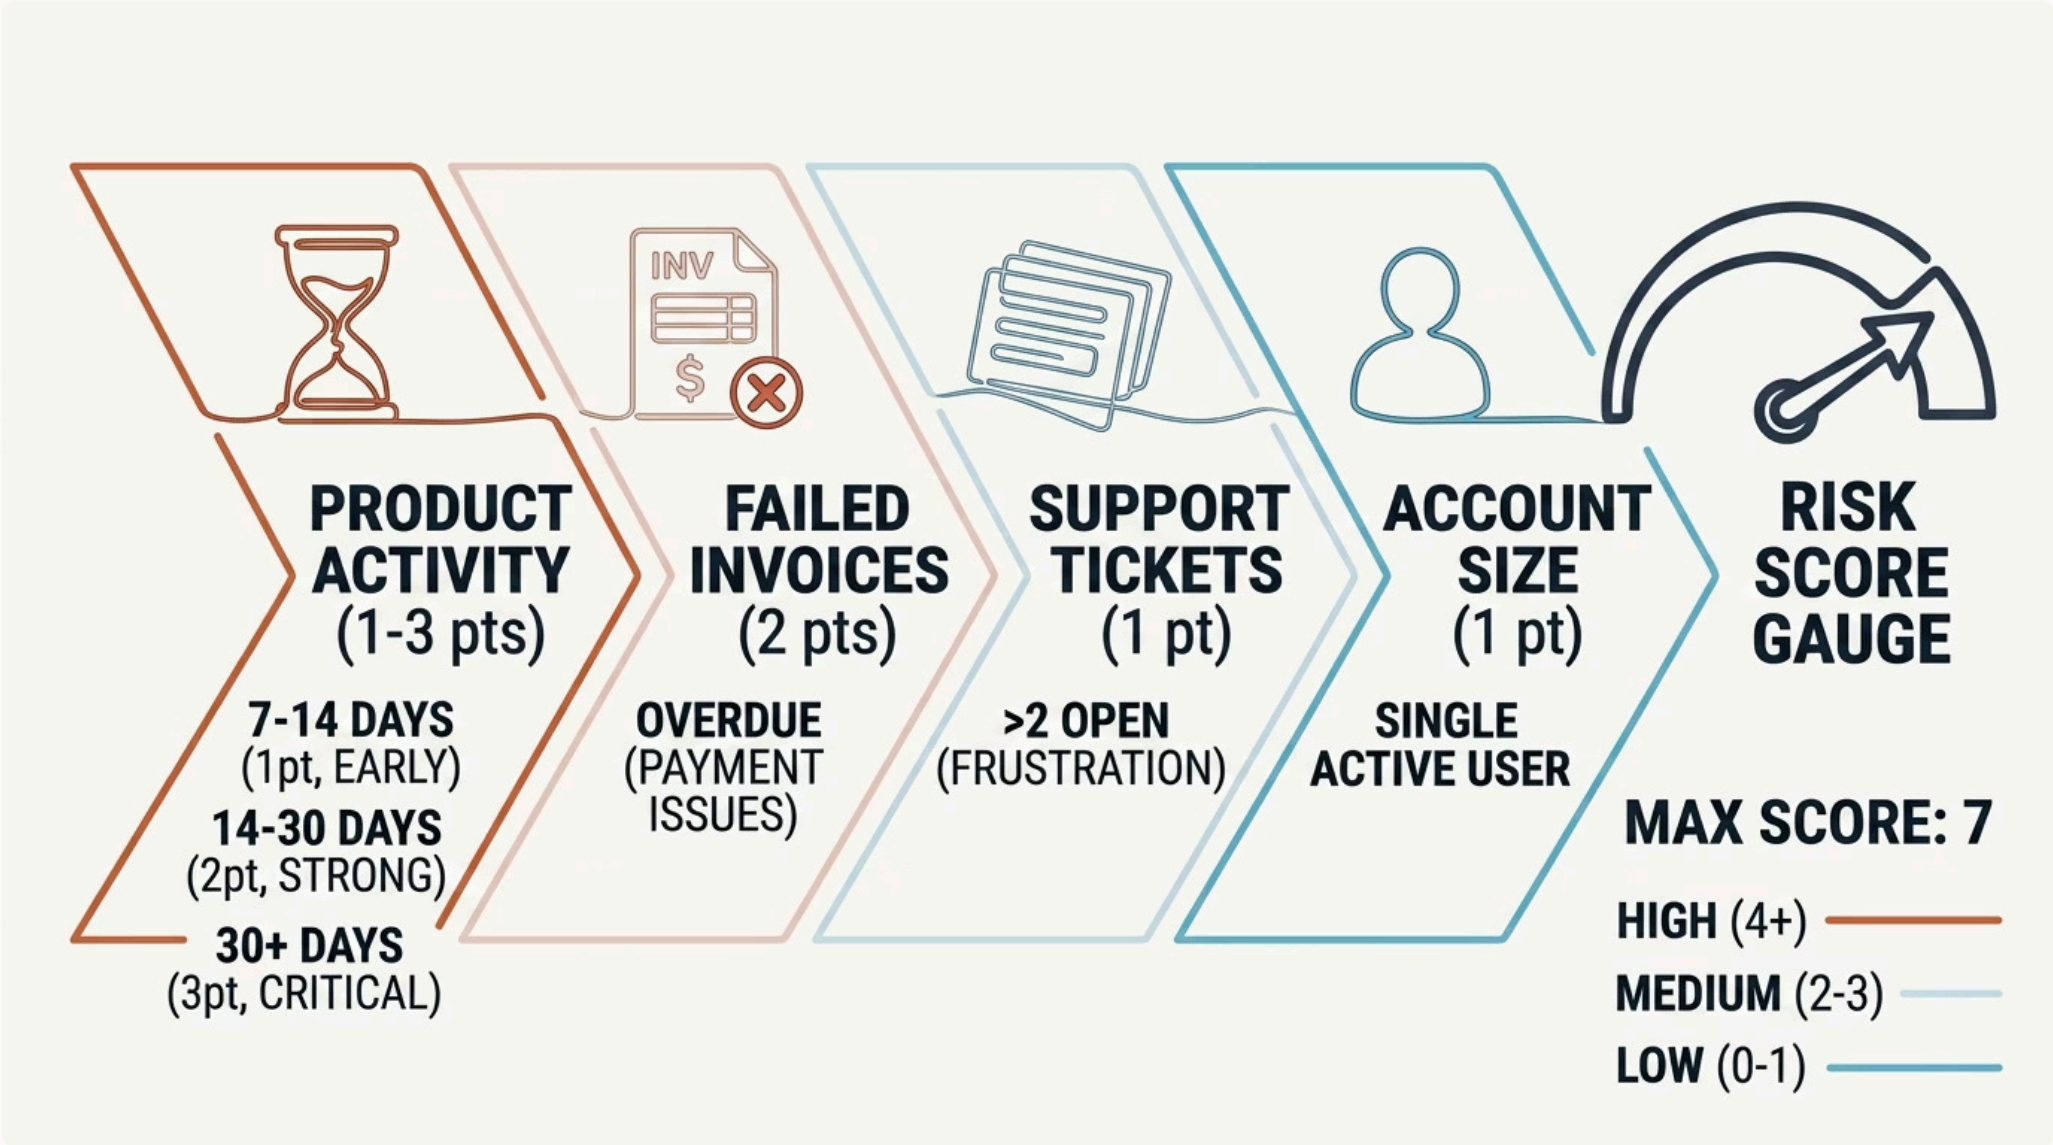
At **59.8% / 40.2%**, XXXXXXX's revenue distribution is materially healthier than the classic 80/20 Pareto benchmark observed in most SaaS businesses.

This indicates a relatively balanced customer base with meaningful contributions from mid-market accounts, **reducing the catastrophic impact** any single large customer departure would have on total MRR.

Top 20% of accounts (127 companies) generate $116,713 MRR. Bottom 80% (510 companies) contribute $78,407 — a far more balanced split than industry norms.

Churn Risk Analysis

A churn risk scoring model was built across all **655 active companies** with paid subscriptions. Each company was scored on four signals derived from product usage, billing, and support data, producing a score from 0 to 7.



⚡ Critical Finding

The **payment failure signal** (2 points) is the single strongest predictor of imminent churn. Companies with at least one failed or overdue invoice in the past 90 days show dramatically higher disengagement in their event logs.

Customer success teams should treat any failed payment as a **churn alert**, not just a billing issue.

Single-User Account Risk

Single-user accounts represent elevated churn risk independent of usage frequency. When the sole user changes role, leaves the organisation, or loses interest, the entire account churns with no internal champion remaining.

Multi-user accounts are significantly stickier because the product becomes embedded in **team workflows** rather than individual habits.

Feature Adoption Analysis

Feature adoption analysed across **838,790 product events** generated by 16,050 users across 800 company accounts throughout 2025.

dashboard_view

Highest volume and broadest user reach. The product's core engagement surface: low error rate, high session duration. Confirms analytics workflows drive majority of engagement.

report_create

2nd highest event volume. Highest average session duration of any feature: users invest significant time in report creation, indicating deep product engagement.

filter_apply

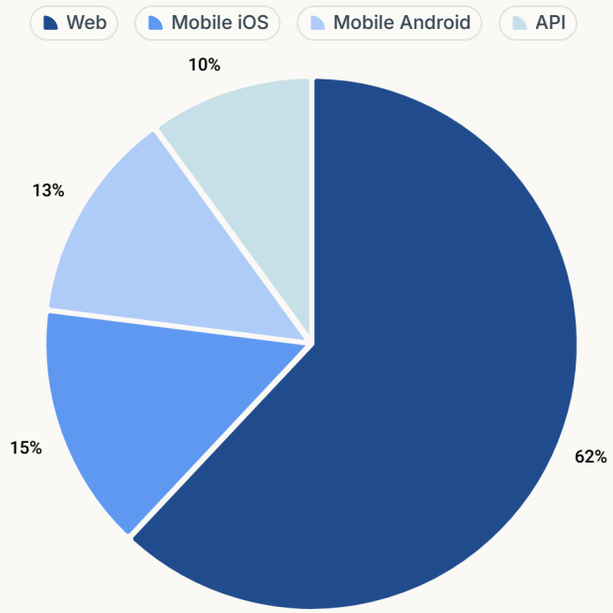
3rd highest volume with very low error rate. High unique user reach suggests this is a universal workflow step used across all plan tiers and industries.

api_call

5th highest volume but **Enterprise-skewed**. Creates the highest switching costs of any product behaviour, once integrated into internal pipelines, migration requires re-engineering.

Platform Distribution

The majority of product interactions occur via the web platform, consistent with a B2B analytics tool used primarily during working hours on desktop.



XXXXXXXs' web dominance (62%) is in line with B2B SaaS analytics tools where desktop usage during working hours is the norm. Mobile combined (28%) sits below the broader market's 66% mobile traffic benchmark from Similarweb 2026, which is expected for enterprise analytics products. API usage (10%) is notably higher than typical B2B SaaS platforms, pointing to strong Enterprise integration adoption and reinforcing the product's position as a professional analytics platform used primarily in business contexts.

Web (62%)

Core product surface — all plans. Prioritise web UX investment for maximum impact across the customer base.

Mobile iOS + Android (28%)

Growth and Business plan users. Secondary surface — maintain feature parity with web to avoid friction.

API (10%)

Enterprise-heavy. Disproportionate strategic value — creates natural switching costs. Expanding API capabilities is one of the highest-ROI product investments for Enterprise retention.

Customer Segmentation

Segmentation analysis conducted across industry vertical, geographic market, and company size to identify which segments deliver the most value and where acquisition and retention effort should be focused.

🌍 Geographic Distribution

22%

Germany

Largest market. Highest SEPA debit adoption — most reliable payment collection.

14%

Netherlands

2nd largest. Strong SEPA adoption, high B2B SaaS buyer concentration.

12%

France

3rd largest. Credit card primary — slightly elevated failed payment rates.

9%

Spain

4th largest. Credit card dominant market with similar payment risk profile.

🏢 Company Size Opportunities

Size	% Base	Opportunity
1–10 employees	25%	Convert to annual billing
11–50 employees	35%	Seat expansion
51–200 employees	22%	Upgrade to Business
201–500 employees	12%	API integration expansion
500+ employees	6%	Multi-year contracts

ⓘ Nordic markets (Sweden, Denmark, Finland) show above-average feature adoption and below-average support ticket volumes — hallmarks of a high-quality, high-LTV customer segment.

Strategic Recommendations

Five recommendations derived directly from analytical findings, each mapped to the responsible team with data-grounded rationale.

1

Payment-Triggered Churn Alert

Owner: Customer Success. Any failed payment should automatically create a high-priority CS task to contact the account within **48 hours** probing product satisfaction, not just collecting payment.

2

Starter-to-Growth Conversion Campaign

Owner: Growth. In-product prompt at the 60-day mark combined with a targeted email sequence showing the Growth plan feature delta. Target: **15–20% conversion** of 220 Starter accounts.

3

Second-User Invitation Prompt

Owner: Product. A prompt at the 30-day mark inviting a colleague to join the account costs nothing and significantly increases stickiness. Multi-user accounts show materially lower churn signals.

4

API Documentation Investment

Owner: Product & Engineering. Expanding API capabilities, improving documentation, and offering dedicated integration support to Enterprise accounts increases switching costs for the highest-value segment.

5

Nordic Market Expansion

Owner: Sales & Marketing. Targeted acquisition push in Sweden, Denmark, and Finland via LinkedIn and G2 review campaigns. These markets yield customers with higher lifetime value than average.

Data Sources & Methodology

This section documents the data sources, pipeline architecture, and analytical methods used to produce the findings in this report.

838K

Product Events

Feature usage, session duration, error rates — full year 2025

905

Subscriptions

MRR, ARR, plan tier, billing cycle, and status across all periods

16K

Users

All active and inactive users — role, last login, account creation

3,676

Support Tickets

Category, priority, CSAT scores, and resolution time

185

dbt Tests

Automated data quality tests covering nullability, uniqueness, and referential integrity

Pipeline Architecture

Raw data loaded into **Snowflake** and transformed using **dbt Core** into a structured analytical layer comprising 6 staging models and 8 mart models. All mart models materialised as tables for query performance.

- **RAW** — 6 tables, faithful copy of source data
- **STAGING** — 6 views, type casting, cleaning, renaming
- **MARTS** — 8 tables, business logic, joins, metrics

Analytical Methods

- Pareto / revenue concentration analysis
- Multi-signal churn risk scoring model
- Cohort retention analysis (D30, D60, D90)
- Plan upgrade path analysis via self-join SQL
- Feature adoption aggregation with window functions
- Geographic segmentation with payment cross-analysis
- Company size segmentation mapped to plan tier distribution
